8 **Supplemental Figure 1** - Observed survival inside the MΦs of single and double resistant

9 clones at 24h post-infection measured as a change in the frequency of resistant bacteria ( $\Delta X$

10 24h) suggest pathways to acquire Rif and Str double resistance. For instance, the results show

11 that Rif<sup>R</sup> H526Y and S531F mutants often benefit from acquiring a Str<sup>R</sup> mutation, in the

12 absence of antibiotics, to adapt to the intra-macrophage environment. The data from the single

13 resistances is taken from Miskinyte and Gordo, 2013 and the data for the double mutants were

14 determined in this study.
